Documentation #1

Style: GOOGLE

Original Code:

```
def calculate_factorial(n):  
    if n == 0:  
        return 1  
    return n * calculate_factorial(n-1)
```

Generated Docstring:

```
"""Executes calculate_factorial operation with conditional logic performing mathematical cal  
  
Args:  
    n (Any): Parameter for controlling n behavior.  
  
Returns:  
    Any: The result of the computation.  
"""
```

Documentation #2

Style: GOOGLE

Original Code:

```
def calculate_factorial(n):  
    if n == 0:  
        return 1  
    return n * calculate_factorial(n-1)
```

Generated Docstring:

```
"""Executes calculate_factorial operation with conditional logic performing mathematical cal  
  
Args:  
    n (Any): Parameter for controlling n behavior.  
  
Returns:  
    Any: The result of the computation.  
"""
```

Documentation #3

Style: GOOGLE

Original Code:

```
def calculate_factorial(n):  
    if n == 0:  
        return 1  
    return n * calculate_factorial(n-1)
```

Generated Docstring:

```
"""Executes calculate_factorial operation with conditional logic performing mathematical cal
```

```
Args:
```

```
    n (Any): Parameter for controlling n behavior.
```

```
Returns:
```

```
    Any: The result of the computation.
```

```
"""
